

### Bugs and issues

- History
  - The minimum and maximum for the X-Axis values may be incorrect with some dates. The data points are still plotted, but the graph presented doesn't show the right X-Axis values for those data points.
  - Need seven dates to be able to set up the spinner and display the graph with the data points.
- Notifications
  - Clicking on the notifications sometimes crashes the app.
  - Notifications no longer work after the app is killed
- Drink Selection Pop-up Window
  - In order for a custom drink to be added, both the Custom radio button and the Custom editText must be checked/have input. If the user only types a custom value but fails to check the Custom radio button, nothing will be logged.
- Firebase Database
  - Was not able to get the Firebase database set up. This is because we had a SQLite database setup for the majority of the project but decided to add user accounts late in the project. Due to the lack of time, we were unable to connect the database to the user accounts. Therefore, all data is stored locally to the phone and will not change based on what user is logged in.
